Input/Output Functional Description

Symbol	Type	Function
$\overline{CK0}\text{--}\overline{CK1}$ $\overline{CK0}\text{--}\overline{CK1}$	Input	The system clock inputs. All address and command lines are sampled on the cross point of the rising edge of CK and falling edge of $\overline{CK}$. A Delay Locked Loop (DLL) circuit is driven from the clock input and output timing for read operations is synchronized to the input clock.
CKE0~CKE1	Input	Activates the DDR2 SDRAM CK signal when high and deactivates the CK signal when low. By deactivating the clocks, CKE low initiates the Power Down mode or the Self Refresh mode.
$\overline{S0}\text{--}\overline{S1}$	Input	Enables the associated DDR2 SDRAM command decoder when low and disables the command decoder when high. When the command decoder is disabled, new commands are ignored but previous operations continue. Rank 0 is selected by $\overline{S0}$, Rank 1 is selected by $\overline{S1}$. Ranks are also called "Physical banks".
$\overline{RAS}$, $\overline{CAS}$, $\overline{WE}$	Input	When sampled at the cross point of the rising edge of CK and falling edge of $\overline{CK}$, $\overline{CAS}$, $\overline{RAS}$, and $\overline{WE}$ define the operation to be executed by the SDRAM.
BA0~BA1	Input	Selects which DDR2 SDRAM internal bank is activated.
ODT0~ODT1	Input	Asserts on-die termination for DQ, DM, DQS, and $\overline{DQS}$ signals if enabled via the DDR2 SDRAM Extended Mode Register Set (EMRS).
A0~A9, A10/AP, A11~A13	Input	During a Bank Activate command cycle, defines the row address when sampled at the cross point of the rising edge of CK and falling edge of $\overline{CK}$. During a Read or Write command cycle, defines the column address when sampled at the cross point of the rising edge of CK and falling edge of $\overline{CK}$. In addition to the column address, AP is used to invoke autoprecharge operation at the end of the burst read or write cycle. If AP is high, autoprecharge is selected and BA0-BAn defines the bank to be precharged. If AP is low, autoprecharge is disabled. During a Precharge command cycle, AP is used in conjunction with BA0-BAn to control which bank(s) to precharge. If AP is high, all banks will be precharged regardless of the state of BA0-BAn inputs. If AP is low, then BA0-BAn are used to define which bank to precharge.
DQ0~DQ63	In/Out	Data Input/Output pins.
DM0~DM7	Input	The data write masks, associated with one data byte. In Write mode, DM operates as a byte mask by allowing input data to be written if it is low but blocks the write operation if it is high. In Read mode, DM lines have no effect.
$\overline{DQS0}\text{--}\overline{DQS7}$ $\overline{DQS0}\text{--}\overline{DQS7}$	In/Out	The data strobes, associated with one data byte, sourced with data transfers. In Write mode, the data strobe is sourced by the controller and is centered in the data window. In Read mode, the data strobe is sourced by the DDR2 SDRAMs and is sent at the leading edge of the data window. $\overline{DQS}$ signals are complements, and timing is relative to the crosspoint of respective DQS and $\overline{DQS}$. If the module is to be operated in single ended strobe mode, all $\overline{DQS}$ signals must be tied on the system board to VSS and DDR2 SDRAM mode registers programmed appropriately.
V_{DD} , V_{DD} SPD, V_{SS}	Supply	Power supplies for core, I/O, Serial Presence Detect, and ground for the module.
SDA	In/Out	This is a bidirectional pin used to transfer data into or out of the SPD EEPROM. A resistor must be connected to V_{DD} to act as a pull up.
SCL	Input	This signal is used to clock data into and out of the SPD EEPROM. A resistor may be connected from SCL to V_{DD} to act as a pull up.
SA0~SA1	Input	Address pins used to select the Serial Presence Detect base address.
TEST	In/Out	The TEST pin is reserved for bus analysis tools and is not connected on normal memory modules(SO-DIMMs).

Absolute Maximum DC Ratings

Symbol	Parameter	Rating	Units	Notes
V_{DD}	Voltage on V_{DD} pin relative to V_{SS}	- 1.0 V ~ 2.3 V	V	1
V_{DDQ}	Voltage on V_{DDQ} pin relative to V_{SS}	- 0.5 V ~ 2.3 V	V	1
V_{DDL}	Voltage on V_{DDL} pin relative to V_{SS}	- 0.5 V ~ 2.3 V	V	1
V_{IN}, V_{OUT}	Voltage on any pin relative to V_{SS}	- 0.5 V ~ 2.3 V	V	1
T_{STG}	Storage Temperature	-55 to +100	°C	1, 2

Note :

- Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
- Storage Temperature is the case surface temperature on the center/top side of the DRAM. For the measurement conditions, please refer to JESD51-2 standard.

AC & DC Operating Conditions

Recommended DC Operating Conditions (SSTL - 1.8)

Symbol	Parameter	Rating			Units	Notes
		Min.	Typ.	Max.		
V_{DD}	Supply Voltage	1.7	1.8	1.9	V	
V_{DDL}	Supply Voltage for DLL	1.7	1.8	1.9	V	4
V_{DDQ}	Supply Voltage for Output	1.7	1.8	1.9	V	4
V_{REF}	Input Reference Voltage	$0.49 \times V_{DDQ}$	$0.50 \times V_{DDQ}$	$0.51 \times V_{DDQ}$	mV	1,2
V_{TT}	Termination Voltage	$V_{REF} - 0.04$	V_{REF}	$V_{REF} + 0.04$	V	3

Note : There is no specific device V_{DD} supply voltage requirement for SSTL-1.8 compliance. However under all conditions V_{DDQ} must be less than or equal to V_{DD} .

- The value of V_{REF} may be selected by the user to provide optimum noise margin in the system. Typically the value of V_{REF} is expected to be about 0.5 x V_{DDQ} of the transmitting device and V_{REF} is expected to track variations in V_{DDQ} .
- Peak to peak AC noise on V_{REF} may not exceed +/-2% $V_{REF}(DC)$.
- V_{TT} of transmitting device must track V_{REF} of receiving device.
- AC parameters are measured with V_{DD} , V_{DDQ} and V_{DDL} tied together.

Operating Temperature Condition

Symbol	Parameter	Rating	Units	Notes
TOPER	Operating Temperature	0 to 95	°C	1, 2, 3

- Operating Temperature is the case surface temperature on the center/top side of the DRAM. For the measurement conditions, please refer to JESD51.2 standard.
- At 85 - 95 °C operation temperature range, doubling refresh commands in frequency to a 32ms period (tREFI=3.9 us) is required, and to enter to self refresh mode at this temperature range, an EMRS command is required to change internal refresh rate.

Input DC Logic Level

Symbol	Parameter	Min.	Max.	Units	Notes
$V_{IH}(DC)$	DC input logic high	$V_{REF} + 0.125$	$V_{DDQ} + 0.3$	V	
$V_{IL}(DC)$	DC input logic low	- 0.3	$V_{REF} - 0.125$	V	

Input AC Logic Level

Symbol	Parameter	DDR2-400, DDR2-533		DDR2-667, DDR2-800		Units
		Min.	Max.	Min.	Max.	
$V_{IH}(ac)$	ac input logic high	$V_{REF} + 0.250$	-	$V_{REF} + 0.200$		V
$V_{IL}(ac)$	ac input logic low	-	$V_{REF} - 0.250$		$V_{REF} - 0.200$	V

AC Input Test Conditions

Symbol	Condition	Value	Units	Notes
V_{REF}	Input reference voltage	$0.5 * V_{DDQ}$	V	1
$V_{SWING(MAX)}$	Input signal maximum peak to peak swing	1.0	V	1
SLEW	Input signal minimum slew rate	1.0	V/ns	2, 3

Notes:

- Input waveform timing is referenced to the input signal crossing through the $V_{IH/IL}(AC)$ level applied to the device under test.
- The input signal minimum slew rate is to be maintained over the range from V_{REF} to $V_{IH}(AC)$ min for rising edges and the range from V_{REF} to $V_{IL}(AC)$ max for falling edges as shown in the below figure.
- AC timings are referenced with input waveforms switching from $V_{IL}(AC)$ to $V_{IH}(AC)$ on the positive transitions and $V_{IH}(AC)$ to $V_{IL}(AC)$ on the negative transitions.
